Invoice Summary

Scope of Work:

1. Received an emergency call from Underground Building Maintenance regarding the air rotation unit not operating. Upon arrival, found that the building temperature was 58 degrees and the air rotation unit was not running due to the thermostat for the unit being set to 55 degrees. Noted that the temperature displayed on the thermostat was for the front furnace, which is located near the front glass doors and reads cooler. The thermostat for the air rotation unit is mounted directly on the unit itself. Adjusted the thermostat above 55 degrees, and the unit started running immediately.
2. Inspected the belts, which appeared to be in brand new condition. Checked the motors and found them to be functioning properly. Noticed that the dampers for outside air had been previously unhooked.
3. Monitored the unit for nearly an hour and observed that it did not trip the high limit and shut off when the thermostat reached the desired temperature.
4. Communicated the findings to Cory via text message.

Resolution:

The issue with the air rotation unit not operating was resolved by adjusting the thermostat to the appropriate temperature. The belts and motors were found to be in good working condition. The unit ran without any issues and did not trip the high limit. No further action was required.
